## **summary**

The purpose of this document is

- › to describe the setup of the sigma.7 haptic device
- › to describe the installation of the software drivers and the Force Dimension SDK
- › to describe the basic operation modes of the sigma.7 haptic device

## **glossary**

SDK            refers to the Software Development Kit (SDK) for all Force Dimension products.

## **2. important safety instructions**

### **IMPORTANT**

WHEN USING THIS HAPTIC DEVICE, BASIC SAFETY PRECAUTIONS  
SHOULD ALWAYS BE FOLLOWED TO REDUCE THE RISK  
OF FIRE, ELECTRICAL SHOCK, OR PERSONAL INJURY.

1. read and understand all instructions
2. follow all warnings and instructions marked on your haptic device
3. do not use or place your haptic device near water
4. place your haptic device securely on a stable surface
5. make sure that the workspace of your haptic device is free of objects
6. do not overload wall outlets and extension cords as this can result in a risk of fire or electrical shock
7. switch off your haptic device when it is not in use
8. to reduce the risk of electrical shock, do not disassemble your haptic device

### 3. setting up the sigma.7 haptic device

This section describes the different steps to follow to safely setup your sigma.7 device before use.

#### IMPORTANT

PLEASE KEEP THE ORIGINAL PACKAGING  
ONLY USE THE ORIGINAL PACKAGING DURING STORAGE OR SHIPMENT

#### 3.1 haptic device installation

The sigma.7 haptic device is shipped in a plastic case and two cardboard boxes. Please start by opening the plastic case which contains the sigma.7 haptic device controller and accessories, as illustrated in figure 2.

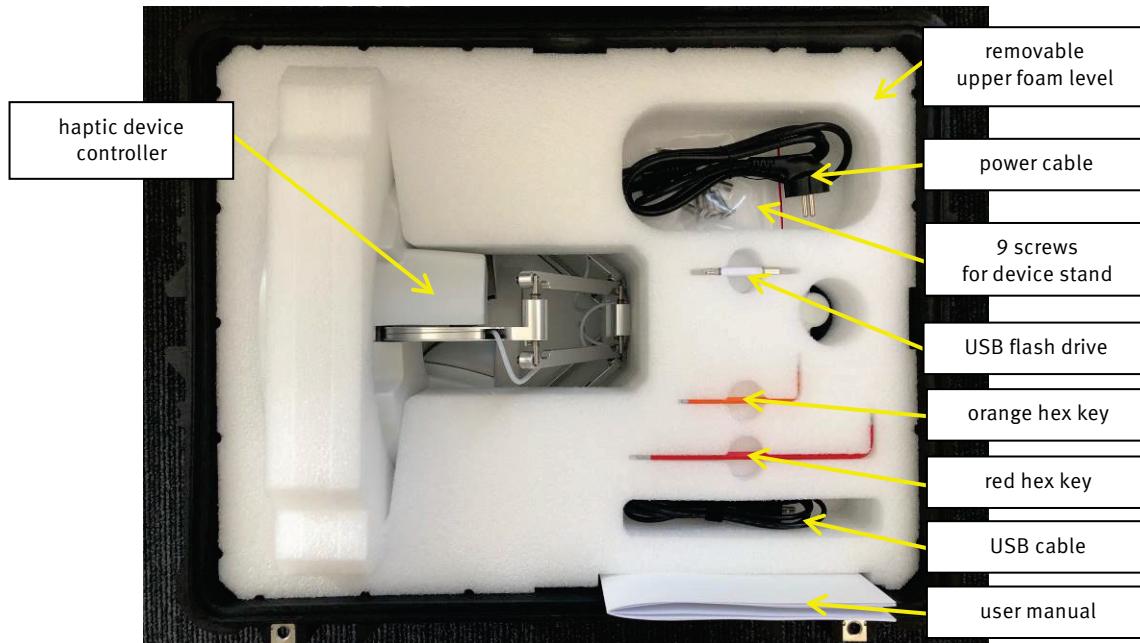

figure 2 – transportation case which contains the sigma.7 device controller and accessories

Among the accessories included in the plastic case are nine screws and an orange hex key that are required to assemble the device stand contained in the two cardboard boxes. The haptic device controller is mounted at the end of the setup procedure and is therefore best kept in its protective case until then.

The operations described in the following steps are best performed by a team of two people.

The **sigma.7 support stand** is composed of **three legs** and **one mast** which are illustrated in figures 3 and 4. These parts can be found in the two cardboard boxes that come with the unit.

figure 3 –stand pole (1x)

figure 4 – stand leg (3x)

The three legs are mounted to the pole by securely fastening the nine **stand screws** (three screws per leg) using the **orange hex key**, as shown in figure 5. The screws and orange hex key can be found in the plastic case that contains the haptic device controller.

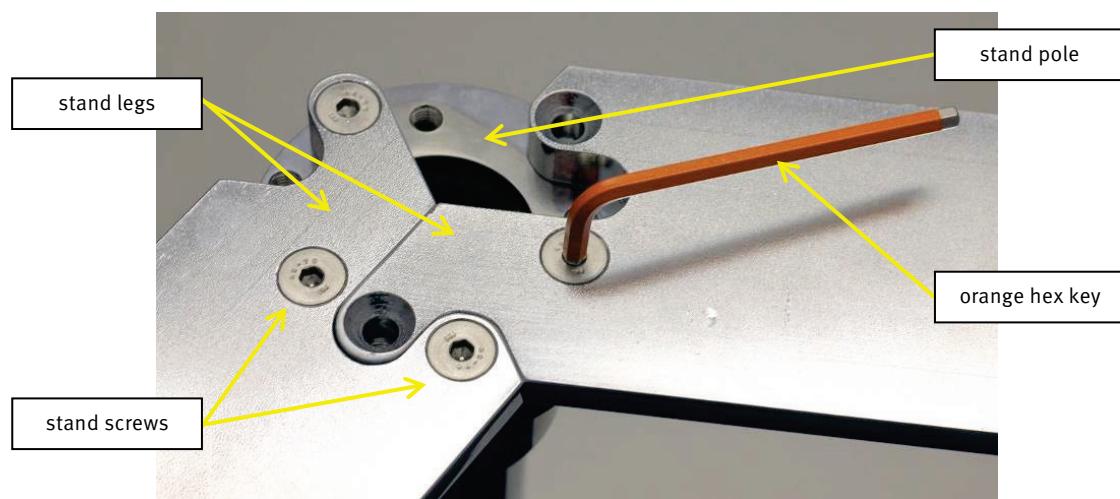

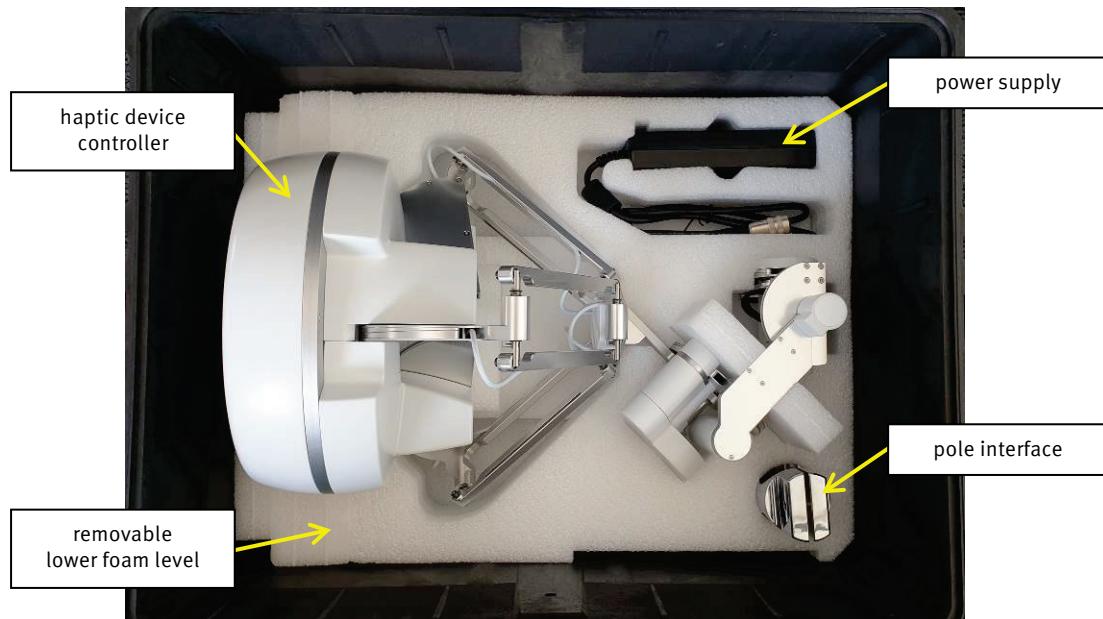

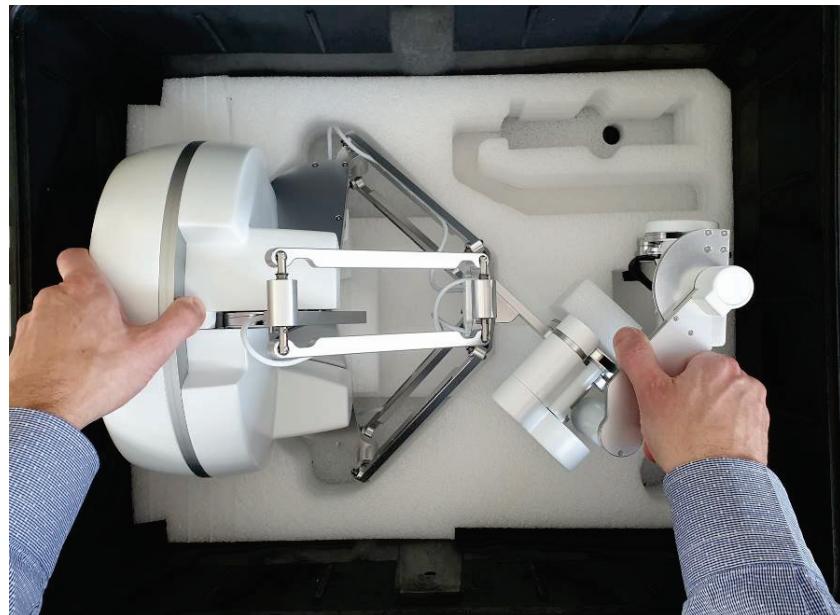

figure 5 – mounting of the device stand legs onto the pole

Once the device stand is mounted, the upper foam level with the accessories may be lifted out of the box, thereby revealing the sigma.7 haptic device controller, as shown in figure 6.

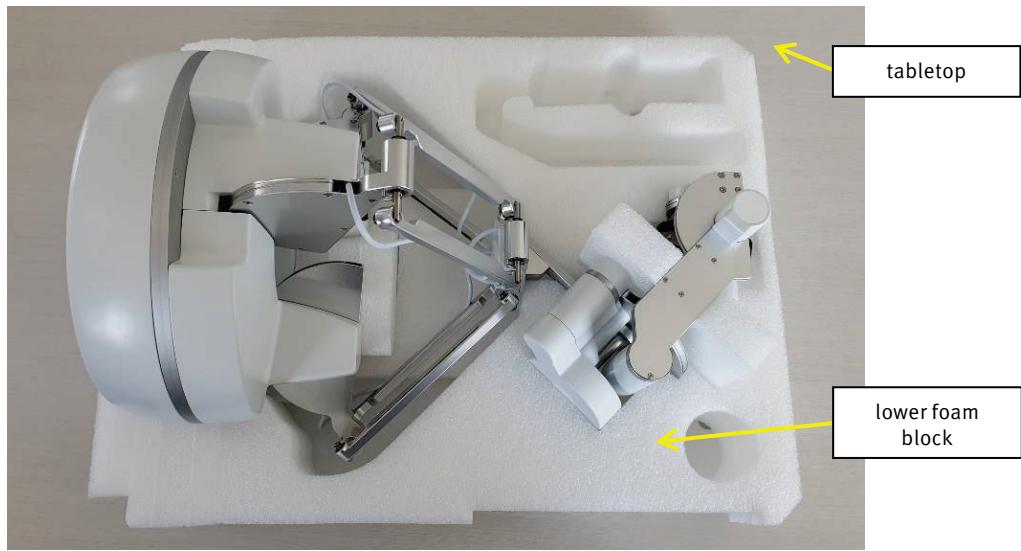

*figure 6 – transportation case containing the sigma.7 device after removal of the upper foam part*

Remove the pole interface and power supply before lifting out the device from its lower foam block as illustrated in figure 7. While a first person may hold the device, a second person may remove the lower foam block and place it on a tabletop or any other stable flat surface. The device can then be installed back on its lower foam block, in its initial configuration, as shown in figure 8.

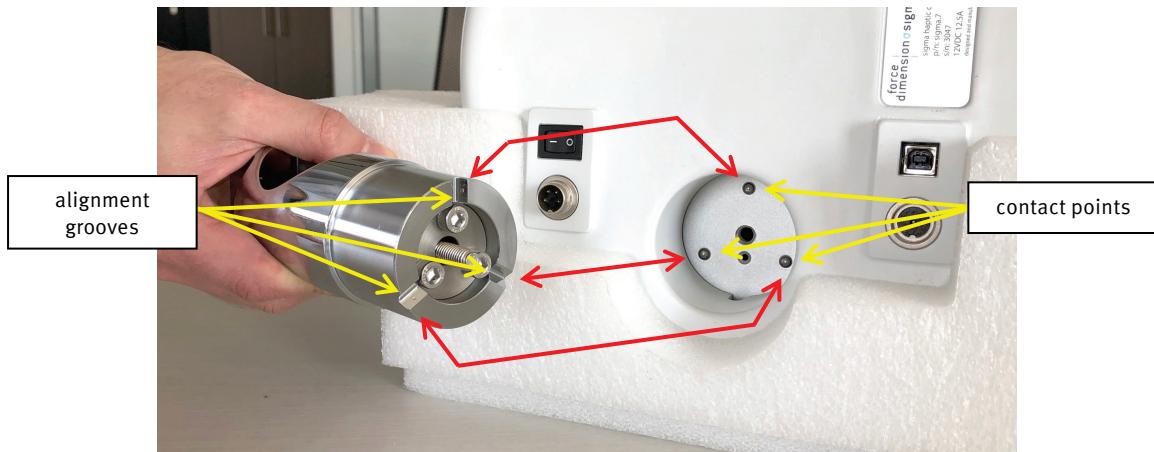

*figure 7 – the device is lifted out of the plastic container*

*figure 8 – the sigma.7 haptic device placed back on its lower foam block and outside of its plastic transportation case*

Insert the **pole interface** at the rear of haptic device controller by **making sure that the grooves of the pole interface align with the spherical contact points** on the device.

*figure 9 – alignment of the pole interface with the contact points of the sigma.7 haptic device*

Securely fasten the **tightening screw** by using the **red hex key**, as illustrated in figure 10.

*figure 10 – mounting of the pole interface to the haptic device controller with the help of the tightening screw*

By using the same **red hex key**, you may now loosen the **clamping screw**, as illustrated on the left image of figure 11.

Finally, mount the sigma.7 device base on its stand pole by sliding it from the top, as shown on the right image of figure 11. Place the haptic device controller at the desired height and lock the mechanism by fastening the clamping screw.

Verify that the device is correctly secured by making sure that the device base cannot rotate around its vertical stand pole. If any slippage occurs, further tightening of the clamping screw may be required.

figure 11 – after loosening the clamping screw, the haptic device controller is mounted on the stand pole

figure 12 – fastening of the clamping screw while holding the device with the opposite hand

Your sigma.7 haptic device is now fully assembled. You may place the haptic device at your console desk where you will be operating the system. Please note that optimal wrist dexterity is achieved when the forearm of the operator is aligned with the first rotational degree of freedom of the wrist mechanism, as shown in figure 13 (yellow dashed lines). This optimal configuration can be obtained by correctly positioning and orientating the device with respect to the operator.

For optimal stability, the rear stand leg (see figure 1) should be aligned with the pole attachment interface protruding from the rear of haptic device controller, as shown in figure 13 (blue dashed lines).

*figure 13 – relative forearm alignment for optimal wrist dexterity (orange dashed lines) and rear leg orientation of stand (blue dashed lines)*

### 3.2 installing the power supply

Plug and tighten the power supply into the power connector. For safety purposes you should only operate your sigma.7 haptic device using the original Force Dimension power supply that came with your haptic device controller. Replacement power supplies can be ordered directly from Force Dimension.

figure 14 – connection and tightening of the power connector

### 3.3 connecting the sigma.7 haptic device to your computer

Connect the sigma.7 haptic device to your computer using the USB cable that is included in the upper foam of the plastic transportation case of the haptic device controller.

### 3.4 software installation

The upper foam level of the haptic device case also contains a USB flash drive which includes the drivers and SDK installation media for the different operating systems.

## 4. configuring the sigma.7 under Windows

### 4.1 installing the software

The USB driver must be first installed onto your system **prior to connecting the sigma.7 to the computer**. To do this, perform the following steps:

1. plug the Force Dimension USB flash drive into your Windows computer
2. open the \Windows folder on the USB flash drive and select the appropriate \32-bit or \64-bit subfolder according to the operating system version on your computer
3. run the installation program and follow its instructions

### 4.2 installation description

The installation program creates the following subfolders in:

C:\Program Files\Force Dimension\ sdk-<version>

#### **\bin subfolder**

This directory contains the demonstration executables and the DLL files required to run the sigma.7 software. The required DLL files are also copied to the Windows system folder during the installation.

#### **\drivers subfolder**

This directory contains the USB drivers required to operate your haptic device.

#### **\examples subfolder**

This directory contains the demonstration programs. Example applications described in section 6.4 and come with their full source code.

#### **\doc subfolder**

All documentation files and notices are located in that directory.

#### **\manuals subfolder**

All hardware user manuals are located in that directory.

#### **\lib,\include subfolders**

These directories contain the files required to compile your application with the Force Dimension SDK. Please refer to the on-line programming manual for more information.

### 4.3 installing the drivers

#### **USB drivers**

The sigma.7 requires the Force Dimension USB driver. These drivers are installed automatically, and no additional step is required.

## 5. configuring the sigma.7 under Linux

### 5.1 installing the software

The Force Dimension development folder must be installed onto your system before the sigma.7 can be used. To do this, perform the following steps:

1. plug the Force Dimension USB flash drive into your Linux computer
2. extract the `sdk-<version>.tar.gz` archive for your system architecture from the \Linux subfolder to the desired location (typically your home folder) by running the following command within the target folder:

```
tar -zxvf sdk-<version>.tar.gz
```

3. this will create a `sdk-<version>` development folder in the target location

### 5.2 installation description

The development folder contains the following directories:

#### **\bin subfolder**

This directory contains the demonstration executables and the binary files required to run the sigma.7 software.

#### **\examples subfolder**

This directory contains the demonstration programs. Example applications described in section 6.4 and come with their full source code.

#### **\doc subfolder**

All documentation files and notices are located in this subfolder.

#### **\manuals subfolder**

All hardware user manuals are located in that directory.

#### **\lib,\include subfolders**

These directories contain the files required to compile your application with the Force Dimension SDK. Please refer to the on-line programming manual for more information.

### 5.3 installing the drivers

The Linux version of the Force Dimension SDK requires the development packages for the `libusb-1.0` to be installed on your Linux distribution.

#### **IMPORTANT**

PLEASE NOTE THAT USB ACCESS TO THE HAPTIC DEVICE REQUIRES SUPERUSER PRIVILEGES ON MOST LINUX DISTRIBUTIONS

## **6. configuring the sigma.7 under macOS**

### **6.1 installing the software**

The Force Dimension development folder must be installed onto your system before the sigma.7 can be used. To do this, perform the following steps:

1. plug the Force Dimension USB flash drive into your Apple computer
2. open the `sdk-<version>.dmg` file for your version of macOS from the `\macOS` folder and extract the `sdk-<version>` folder to the desired location (typically your home folder)
3. this will create a `sdk-<version>` development folder in the target location

### **6.2 installation description**

The development folder contains the following directories:

#### **\bin subfolder**

This directory contains the demonstration executables and the binary files required to run the sigma.7 software.

#### **\examples subfolder**

This directory contains the demonstration programs. Example applications described in section 6.4 and come with their full source code.

#### **\doc subfolder**

All documentation files and notices are located in this subfolder.

#### **\manuals subfolder**

All hardware user manuals are located in that directory.

#### **\lib,\include subfolders**

These directories contain the files required to compile your application with the Force Dimension SDK. Please refer to the online programming manual for more information.

### **6.3 installing the drivers**

The macOS version of the Force Dimension SDK uses Apple's native USB drivers. No further installation is required.

## 7. operating the sigma.7

### 7.1 coordinate system

#### base translation

The position of the center of the end-effector (handle) is expressed in Cartesian coordinate and in IUS (metric) unit. Figure 15 illustrates the coordinate system. You will notice that the X-axis of the coordinate system is parallel to the first revolute axis of the wrist.

The actual origin of the coordinate system (0,0,0) is located on a virtual point situated at the center of the physical workspace of the haptic device.

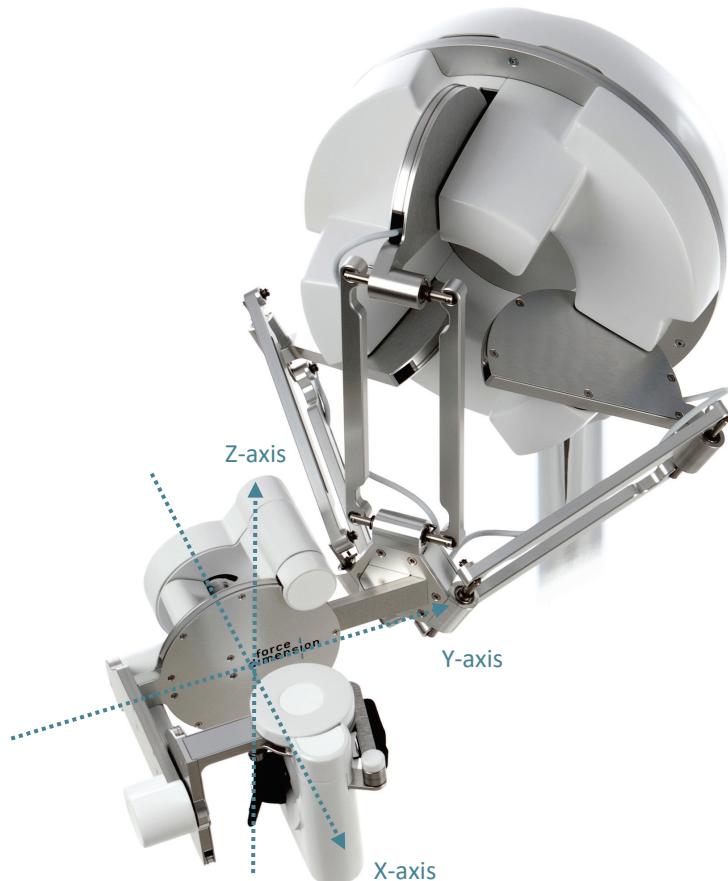

figure 15 – Cartesian coordinate system of the sigma.7 haptic device

## wrist orientation

The orientation of the sigma.7 haptic device is expressed by a reference frame  $R_{wrist}$  which is numerically represented using a  $3 \times 3$  rotation matrix. This reference frame is expressed in relation to the world coordinate system described in figure 15.

The reference frame of the wrist is computed from the angle values returned by the joint sensors mounted of each revolute axis of the wrist as illustrated in figure 16. When all joint angles are equal to zero, an identity rotation matrix is returned.

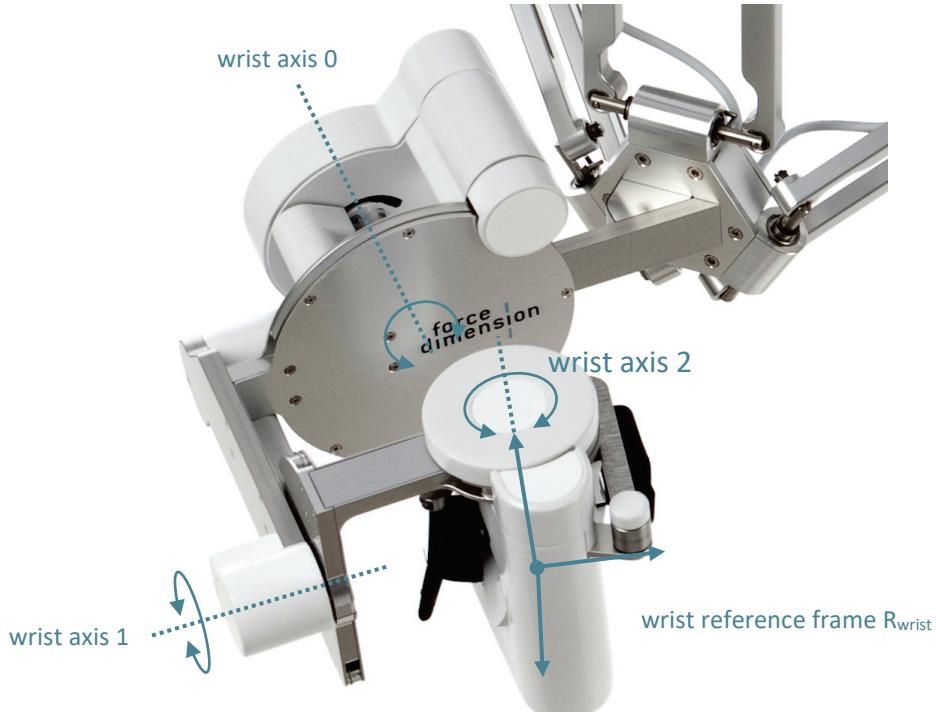

figure 16 – reference frame of the wrist of the sigma.7 haptic device

## gripper angle

The angular position of the force gripper is returned in either degrees or radian.

A **positive angle value** is returned for **right-hand** sigma.7 haptic devices. A **negative angle value** is returned for **left-hand** haptic devices.

Angular values closer to zero correspond to configurations where the force gripper is in a closed configuration. Opening of the force gripper increases the magnitude of the angle.

## **7.2 operating modes**

### **calibration**

Calibration of the haptic device controller is necessary to obtain accurate, reproducible localization of the end-effector within the workspace of the haptic device. The sigma.7 is designed in such a way that there can be no drift of the calibration over time, so the procedure only needs to be performed once each time the device is powered ON.

The automatic calibration procedure is performed by software using the Force Dimension SDK, for example by launching the application "**HapticInit**" which automatically drives the device throughout its workspace. Please do not touch the device during this automatic calibration procedure. After calibration, the device is ready for normal operation.

### **gravity compensation**

To prevent user fatigue and to improve dexterity during manipulation, the sigma.7 features gravity compensation. When gravity compensation is enabled, the weights of the arms and of the end-effector are taken into account and a vertical force is dynamically applied to the end-effector in addition to the desired user force command. Please note that gravity compensation is computed on the host computer, and therefore only gets updated every time a new force command is sent to the haptic device by the application. Gravity compensation is enabled by default and can be disabled through the Force Dimension SDK.

### **forces**

By default, and when an application opens a connection to the haptic device controller, all forces are initially disabled. Forces can be enabled or disabled through the Force Dimension SDK.

### **brakes**

The device features electromagnetic brakes that can be enabled through the Force Dimension SDK. These brakes are enabled by default every time the forces are disabled. When the brakes are engaged, a viscous force is created that prevents rapid movement of the end-effector.

### 7.3 running the Haptic Desk program

The Haptic Desk application is available as a test and diagnostic program and offers the following capabilities:

- › list all Force Dimension haptic devices connected to the system
- › test the position reading of the haptic device in Cartesian coordinates
- › test all force and torque capabilities of the haptic device
- › run the auto-calibration procedure
- › read the haptic device status
- › read the haptic device encoder sensors individually
- › read the haptic device user button (if available)

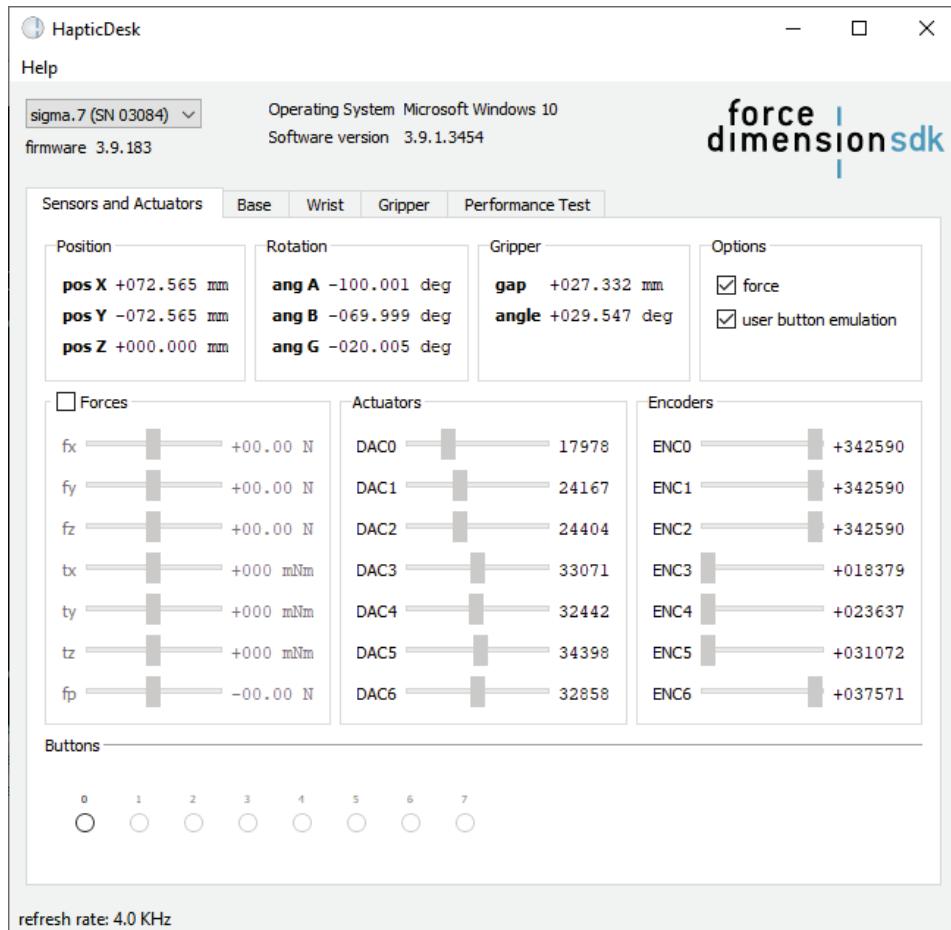

figure 17 – Haptic Desk test and diagnostic program

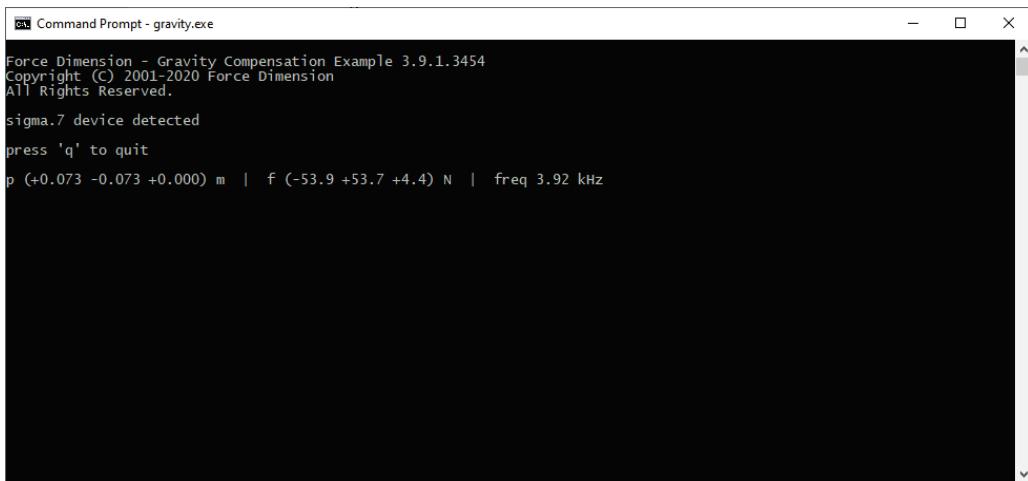

## 7.4 running the demonstrations programs

Two demonstration programs can also be used to diagnose the device. The source code and an executable file for each of these demonstration programs are provided in two separate directories named \gravity and \torus.

Once the system is setup, we suggest running application **gravity** to check that everything is working properly and to evaluate your system's performance independently of the graphics rendering performance. Application **torus** will allow you to test the combined performance of haptics and graphics rendering.

### gravity example

This example program runs a best effort haptic loop to compensate for gravity. The appropriate forces are applied at any point in space to balance the device end-effector so that it is safe to let go of it. The refresh rate of the haptic loop is displayed in the console every second.
